The driveshaft has a vane-type low pressure fuel supply pump whose pressure is regulated by a pressure control valve (2). The vane-type pump consists of a eccentric ring (3) and a support ring (4). Excessive pressure from the vane pump is discharged through control valve (2) into the distributor pump housing.

Safety. Because of the need for positive injection into a very high-pressure environment, the pump develops great pressure—typically 15,000 psi (100 MPa) or more on newer systems. This is a good reason to take great care when working on diesel systems; escaping fuel at this sort of pressure can easily penetrate skin and clothes, and be injected into body tissues with medical consequences ...
